

SIM5360_Hardware Design_V1.01

Document Title	SIM5360 Hardware Design	
Version	1.01	
Date 2013-11-22		
Status	Status Release	
Document Control ID SIM5360_Hardware Design_V1.01		

General Notes

SIMCom offers this information as a service to its customers, to support application and engineering efforts that use the products designed by SIMCom. The information provided is based upon requirements specifically provided to SIMCom by the customers. SIMCom has not undertaken any independent search for additional relevant information, including any information that may be in the customer's possession. Furthermore, system validation of this product designed by SIMCom within a larger electronic system remains the responsibility of the customer or the customer's system integrator. All specifications supplied herein are subject to change.

1 Introduction

This document describes electronic specifications, RF specifications, function interface, mechanical characteristic and testing conclusions of the SIMCom SIM5360 module. With the help of this document and other SIM5360 software application notes, user guides, users can quickly understand and use SIM5360 module to design and develop applications quickly.

1.1 Product Outline

Designed for global market, SIM5360 is a quad-band GSM/GPRS/EDGE and dual-band UMTS /HSDPA that works on frequencies of GSM 850MHz, EGSM 900 MHz, DCS 1800 MHz, PCS 1900MHz and WCDMA 2100/900MHz, 1900/850 MHz. User can choose the module based on the wireless network configuration. In this document, the entire radio band configuration of SIM5360 series is described in the following table.

Table 1: SIM5360 series frequency bands

Standard	Frequency	SIM5360E	SIM5360A
	GSM 850MHz	✓	✓
CCM	EGSM 900MHz	✓	✓
GSM	DCS1800MHz	✓	✓
	PCS1900MHz	✓	✓
	WCDMA 850MHz		✓
WCDMA	WCDMA 900MHz	✓	
WCDMA	WCDMA 1900MHz		✓
	WCDMA 2100MHz	✓	
HCDA	HSDPA	✓	✓
HSPA	HSUPA	✓	✓
GNSS	GPS	✓	✓
UNSS	GLONASS	✓	✓

With a tiny configuration of 30*30*2.9 mm and integrated functions, SIM5360 can meet almost any space requirement in users' application, such as Smart phone, PDA phone, industrial handhelds, machine-to-machine, vehicle applications, etc..

There are 82 pins on SIM5360, which provide most application interfaces for customers' board.

1.2 Hardware Interface Overview

Sub-interfaces are described in detail in the next chapter, which includes:

- Power Supply
- USB Interface
- Serial Interface
- SD card Interfaces
- SIM Interface
- GPIO
- ADC
- LDO Power Output
- Sink Current Source
- PCM Interface
- Keypad Interface
- SPI Interface
- RTC
- I2C Interface

1.3 Hardware Diagram

The global architecture of the SIM5360 Embedded module is described in the figure below.

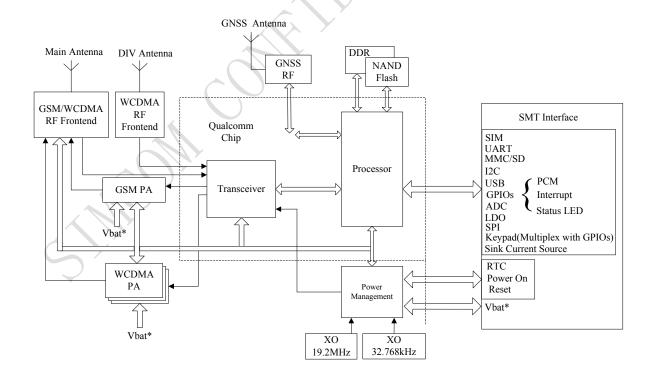

Figure 1: SIM5360 functional architecture

1.4 Functional Overview

Table 2: General Feature

Feature	Implementation			
Power supply	Single supply voltage 3.3~4.2V			
	 Dual-mode UMTS/HSDPA/EDGE/GPRS operation 			
	• GPRS Class B, multislot class 12 operation, Supports coding scheme:			
	CS1-4			
m	• EDGE multislot class 12 operation, Supports coding schemes			
Transmission data	MSC1-9			
	• UMTS R99 data rates-384 kbps DL/UL			
	 Category 6 HSDPA -14 Mbps HSUPA-5.76 Mbps 			
	• CSD feature: 9.6, 14.4, 64 kbps UL/DL			
	GNSS engine (GPS and GLONASS)			
CNICC	Protocol: NMEA			
GNSS	Mobile-Assisted modeMobile-based mode			
	Standalone mode			
	MT, MO, CB, Text and PDU mode			
CMC	SMS storage: SIM card			
SMS	• Support transmission of SMS alternatively over CSD or GPRS.			
	User can choose preferred mode.			
SIM interface	Support identity card: 1.8V, 3V.			
	Speech codec modes:			
	• Half Rate (ETS 06.20)			
	• Full Rate (ETS 06.10)			
Audio features(optional)	 Enhanced Full Rate (ETS 06.50 / 06.60 / 06.80) 			
	• AMR (WCDMA)			
	• AMR+QCP (GSM)			
	• A5/1, A5/2, and A5/3 ciphering			
Serial interface	Serial Port standard or null modem mode on Serial Port Interface			
	 Serial Port can be used to control module by sending AT command 			
USB	Support USB2.0 Slave mode			
Phonebook management	Support phonebook types: SM, FD, LD, RC, ON, MC.			
SIM application toolkit	Support SAT class 3, GSM 11.14 Release 98			
• •	Support USAT			
Real Time Clock	Support RTC			
Timer function	Programmable by AT command			
Physical characteristics	Size:30*30*2.9mm Weight:TBD g			
	Firmware upgrade over USB interface			
Firmware upgrade	Firmware upgrade over USB interface			
Firmware upgrade PCM	Firmware upgrade over USB interface Multiplex on GPIOs. 3 kinds of coding formats: 8 bit (v-law or A-law) and 16 bit (linear).			

- Extended operation temperature: -40°C to +85°C
- Storage temperature -40°C to +90°C

2 Package Information

2.1 Pin Configuration

All hardware interfaces which connect SIM5360 to customers' application platform are through 82 pins pads (Metal half hole). Figure 2 is SIM5360 outline diagram.

USB					
USB_VBUS	I	USB power supply input			
USB_DP	I/O	Plus (+) line of the differential, bi-directional USB signal to/from the peripheral device.	They are compliant with the USB 2.0 specification.		
USB_DM	I/O	Minus (-) line of the differential, bi-directional USB signal to/from the peripheral device.	If it is unused, keep open.		
Serial interface					
UART_RXD	I	Receive Data			
UART_TXD	O	Transmit Data	UART_RXD has been		
UART_RTS	O	Request to send	pulled down with a 12kR		
UART_CTS	Ι	Clear to Send	resistor to ground in the		
UART_RI	О	Ring Indicator	module.		
UART_DTR	I/O	DTE get ready	If it is unused, keep open.		
UART_DCD	RT_DCD O Carrier detects				
I2C interface					
I2C_SDA	I/O	I2C data	Pulled up with a 2.2kR		
I2C_SCL	O	I2C clock output	resistor to 2.6V internally. If it is unused, keep open.		
Keypad interface					
KEYPAD_0	O	Bit 0 drive to the pad matrix			
KEYPAD 1	O	Bit 1 drive to the pad matrix			
KEYPAD 2	О	Bit 2 drive to the pad matrix			
KEYPAD 3	О	Bit 3 drive to the pad matrix			
KEYPAD 4	O	Bit 4 drive to the pad matrix			
KEYSENSE_N0	I	Bit 0 for sensing key press on pad matrix	All Keypad pins can be		
KEYSENSE_N1	I	Bit 1 for sensing key press on pad matrix	configured as GPIOs. If it is unused, keep open.		
KEYSENSE_N2	I	Bit 2 for sensing key press on pad matrix			
KEYSENSE_N3	I	Bit 3 for sensing key press on pad matrix			
KEYSENSE_N4	I	Bit 4 for sensing key press on pad matrix			
PCM interface					
PCM_DIN/GPIO0	I	General Input PIN with module wake/interrupt. It also can be	If it is unused, keep open.		

		multiplexed as the PCM_DIN pin.	
PCM_SYNC/GPIO2	I	General Input PIN. It also can be multiplexed as the PCM_SYNC pin.	
PCM_CLK/GPIO3	O	General Output PIN. It also can be multiplexed as the PCM CLK pin.	
PCM_DOUT/GPIO5	O	General Output PIN. It also can be multiplexed as the PCM_DOUT pin.	
GPIOs			
GPIO1	O	Output PIN as LED control for network status.	
GPIO4	I	Input PIN as RF operating control.	
GPIO40	О	Output PIN as operating status indicating of module.	
GPIO41	I/O	General input/output PIN. It can be used as wake/interrupt signal to host from module	If it is unused, keep open.
GPIO43	I/O	General input/output PIN. It can be used as wake/interrupt signal to module from host.	
GPIO44	I/O	General input/output PIN.	
GPIO42	I/O	General input/output PIN.	
Other interface			
RESET	I	System reset in, active low.	
CURRENT_SINK	I	Current source of ground-referenced current sink	Refer to 3.13.1
ADC1	I	Analog Digital Converter Input	Refer to 3.13.3
ADC2	I	Battery temperature ADC input pin	
MAIN_ANT	I/O	ANT soldering pad	
GNSS_ANT	I/O	GNSS ANT soldering pad	
DIV_ANT	I/O	Diversity ANT soldering pad	

2.3 Package Dimensions

The following figure shows mechanical dimensions of SIM5360.

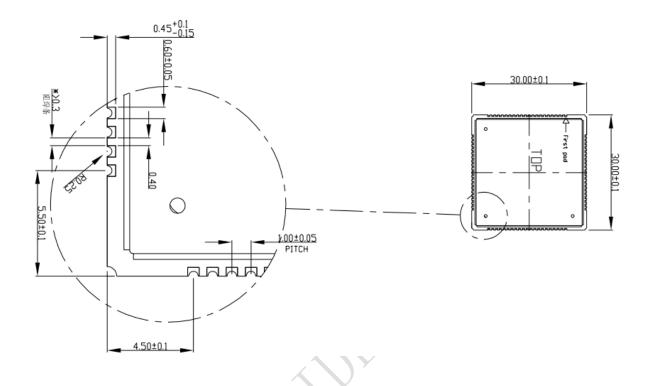

Figure 3: Top dimensions (Unit: mm)

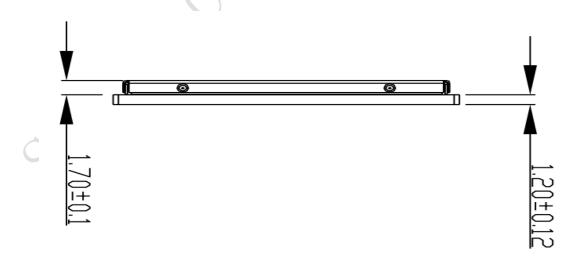

Figure 4: Side dimensions (Unit: mm)

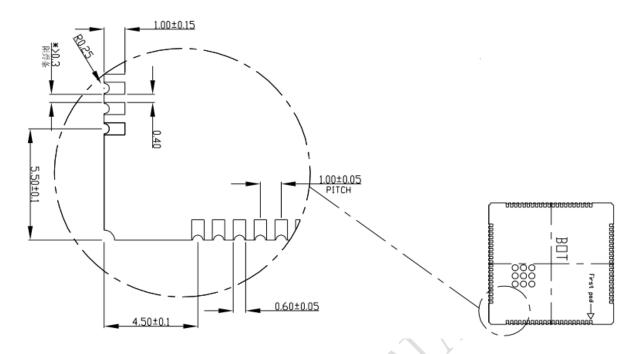

Figure 5: Bottom dimensions (Unit: mm)

2.4 Footprint Recommendation

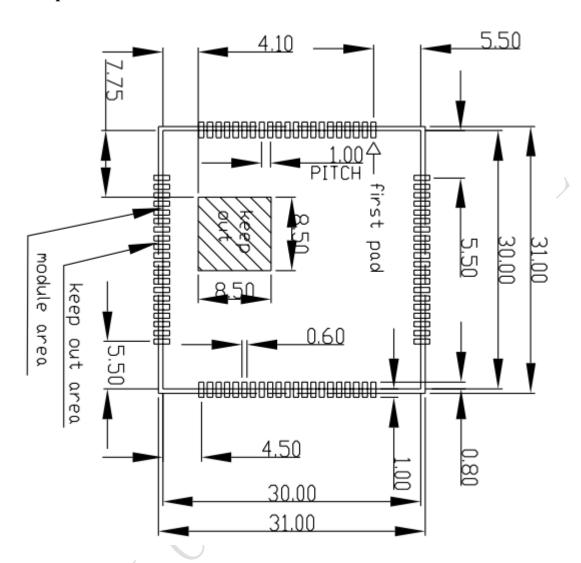

Figure 6: Footprint recommendation (Unit: mm)

3 Application Interface Specification

3.1 Power Supply

The power supply pins of SIM5360 include two VBAT pins . VBAT directly supplies the power to RF PA and baseband system. For the VBAT, the ripple due to GSM/GPRS emission burst (every 4.615ms) may cause voltage drop, and the current consumption rises typically to peak of 2A. So the power supply must be able to provide sufficient current up to more than 2A. The following figure is the VBAT voltage ripple wave at the maximum power transmit phase.

The test condition: VBAT =4.0V, VBAT maximum output current =2A, C_A =100 μ F tantalum capacitor (ESR=0.7 Ω) and C_B =1 μ F(Please refer to Figure 8—Application circuit).

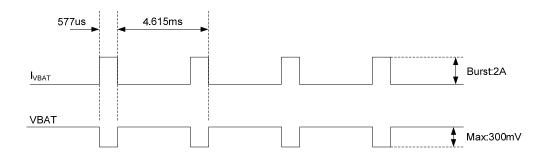

Figure 7: VBAT voltage drop during burst emission (GSM/GPRS)

3.1.1 Power Supply Pin

Two VBAT pins are dedicated to connect the supply voltage.

Table 5: Pin description

Pin type	Pin name	Min	Тур	Max	Unit
POWER	VBAT	3.3	3.8	4.2	V

Note:

1. When the module is power off, users must pay attention to the issue about current leakage. Refer to Chapter 3.10.2 Note2.

3.1.2 Design Guide

Make sure that the input voltage at the VBAT pin will never drop below 3.3V even during a transmit burst when the current consumption rises up to more than 2A. If the power voltage drops below 3.3V, the module may be shut down automatically. Using large tantalum capacitors (above 100uF) will be the best way to reduce the voltage drops. If the power current cannot support up to 2A, users must introduce larger capacitor (typical 1000uF) to storage electric power, especially GPRS multiple time slots emission.

For the consideration of RF performance and system stability, some multi-layer ceramic chip (MLCC) capacitors (0.1/1uF) need to be used for EMC because of their low ESR in high frequencies. Note that capacitors should be put beside VBAT pins as close as possible. Also User should minimize the PCB trace impedance from the power supply to the VBAT pins through widening the trace to 80 mil or more on the board. The following figure is the recommended circuit.

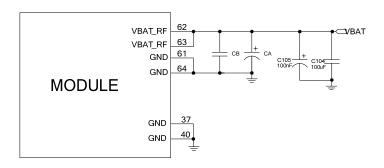

Figure 8: VBAT input application circuit

There are three sections about how to design and optimize users' power systems.

Power supply circuit

We recommend DCDC or LDO is used for the power supply of the module, make sure that the peak current of power components can rise up to more than 2A. The following figure is the reference design of +5V input power supply. The designed output for the power supply is 4.1V, here a linear regulator can be used.

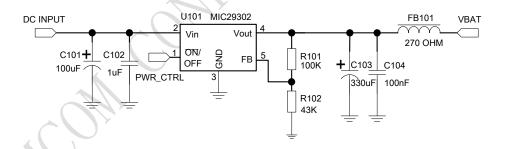

Figure 9: Reference circuit of the LDO power supply

If there is a big difference between the input voltage and the desired output (VBAT), a switching converter power will be preferable because of its better efficiency, especially at the high current situation. The following figure is the reference circuit. Note that DCDC may deprave RF performance because of ripple current intrinsically.

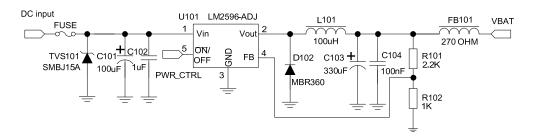

Figure 10: Reference circuit of the DCDC power supply

Voltage monitor

To monitor the power supply voltage, user can use the AT command "AT+CBC", this command has two parameters: the battery status and the voltage value (mV). It will return the capacity percentage and actual value of battery (at the VBAT pin). The voltage is continuously measured at intervals, whenever the measured battery voltage is lower than a specific value set by the AT command "AT+CVALARM". For example, if the voltage value is set to be 3.4V, the following URC will be presented: "warning! voltage is low: 3.3v".

If the voltage is lower than a specific value which is set by the AT command "AT+CPMVT", the module will be powered off automatically and AT commands cannot be executed any more.

Note: Under-voltage warning function is disabled by default, user can enable it by the AT command "AT+CVALARM". Auto power off feature is disabled by default, user should set it by the AT command "AT+CPMVT" to an appropriate value. Please refer to Document [1].

3.1.3 RTC Backup

The module uses RTC (Real Time Clock) to update and maintain inherent time and keeps system alive at no power supply status. The RTC power supply of module can be provided by an external capacitor or a battery (non-chargeable or rechargeable) through the VRTC. The following figures show various reference circuits for RTC back up. The discharge current is less than 10uA. If this feature is used, please refer to the AT commands "AT+CTZU" and "AT+CTZR".

• External capacitor backup

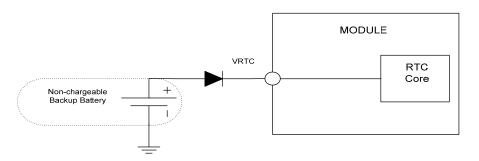

Figure 11: RTC supply from capacitor

Non-chargeable battery backup

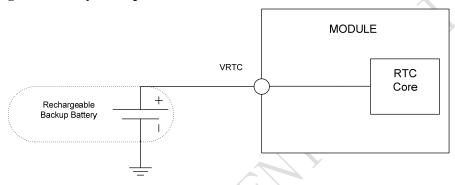

Figure 12: RTC supply from non-chargeable battery

• Rechargeable battery backup

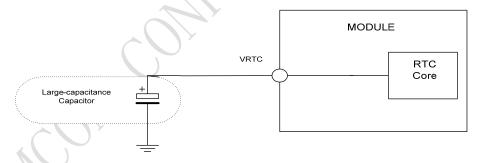

Figure 13: RTC supply from rechargeable battery

Note: The VRTC can be disabled, jus disconnect it in application circuit.

Coin-type rechargeable battery is recommended, such as XH414H-IV01E form Seiko can be used. Typical charge-discharge curves for this battery are shown in the following figure.

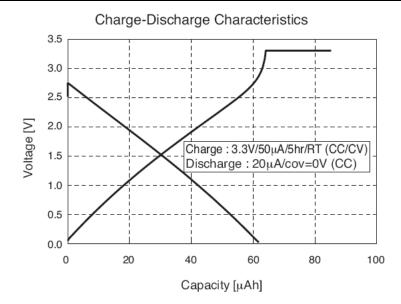

Figure 14: Seiko XH414H-IV01E Charge-Discharge characteristic

3.2 Power on/off Time Sequence

3.2.1 Power on Sequence

SIM5360 can be powered on by POWER_ON pin, which starts normal operating mode.

POWER_ON pin is pulled up with a 200kR resistor to 1.8V in module. User can power on the SIM5360 by pulling the POWER_ON pin down for a short time. The power-on scenarios are illustrated in the following figures.

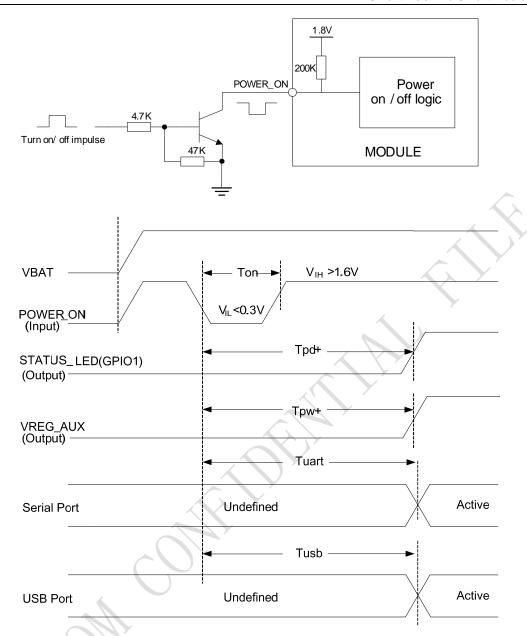

Figure 15: Power on Timing Sequence

Table 6: Power on timing

Domomoton	Description	T	Unit		
Parameter	Description	Min.	Typ.	Max.	Omt
Ton	The time to pull POWER_ON down to power on	-	TBD	-	ms
TpD+	The time to indicate connecting with the network	-	-	TBD	S
Tpw+	The time to indicate the module is powered on completely	-	-	TBD	S
Tuart	The time to enable UART	-	-	TBD	S
Tusb	The time to enable USB	-	-	TBD	S

Note: Module could be automatically power on by connecting Power ON pin to Low level directly. Before designing, please refer to Document [27] for more detail.

3.2.2 Power off Sequence

The following methods can be used to power down SIM5360. These procedures will make module disconnect from the network and allow the software to enter a safe state, and then save data before completely powering the module off.

- Method 1: Power off SIM5360 by pulling the POWER ON pin down
- Method 2: Power off SIM5360 by AT command

User can power off the SIM5360 by pulling POWER_ON down for a specific time. The power off scenario is illustrated in the following figure.

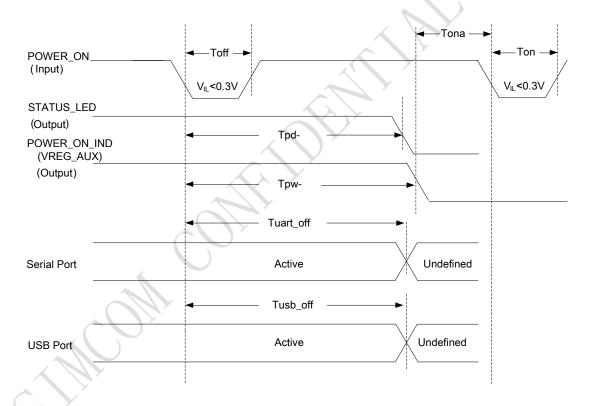

Figure 16: Power off timing sequence

Table 7: Power off timing

Parameter	Description	Ti			
r ar ameter	Description	Min.	Typ.	Max.	Unit
Toff	The time pulling POWER_ON down to power off	TBD	-	TBD	S

TpD-	The time to indicate disconnecting from the network	-	-	TBD	S
Tpw-	The time to indicate the module power off completely	-	-	TBD	S
Tuart_off	The time to disable UART	-	-	TBD	S
Tusb_off	The time to disable USB	-	-	TBD	S
Tona	The time to power on again after Tpw-	0	-	-	S

User can also use the AT command "AT+CPOF" to power down the module. After that, the AT commands cannot be executed any longer. The module enters the POWER DOWN mode, only the RTC is still active. For details, refer to *Document* [1].

3.3 UART Interface

SIM5360 provides a UART (universal asynchronous serial transmission) port. It consists of a flexible 7-wire serial interface. The module is as the DCE (Data Communication Equipment) and the client PC is as the DTE (Data Terminal Equipment). AT commands are entered and serial communication is performed through UART interface.

In order to prevent the UART signals of the module damaged due to voltage spikes or ESD, some resistors can be added on UART signals. The values of resistors are adjusted according to the actual circuit. The resistors should be placed close to the module.

The application circuit is in the following figures.

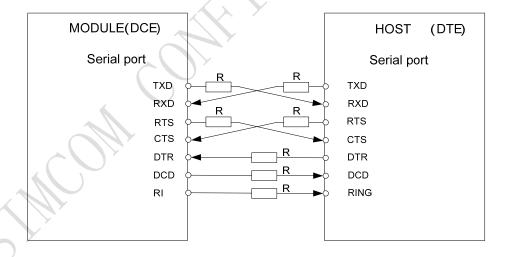

Figure 17: Full modem

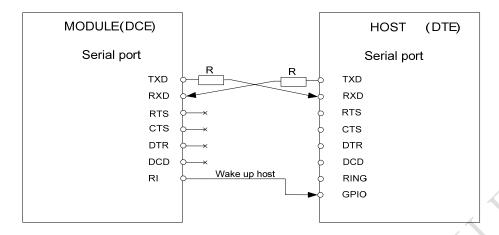

Figure 18: Null modem

3.3.1 Pin Description

Table 8: Pin description

Pin type	Pin name	Pin No.	I/O	Active voltage	Default Status
	UART_RXD	68	I	High/Low	Pull-Down
	UART_TXD	71	O	High/Low	Pull-Up
	UART_RTS	66	O	High/Low	
UART	UART_CTS	67	I	High/Low	Pull-Up
	UART_DTR	72	I	High/Low	Pull-Up
	UART_DCD	70	O	High/Low	
	UART_RI	69	O	High/Low	

More pin information refers to chapter 2.2.

Table 9: Logic level

Parameter	Min	Max	Unit
Logic low input	-0.3	0.63	V
Logic high input	1.17	2.0	V
Logic low output	0	0.45	V
Logic high output	1.35	1.8	V

3.3.2 Application Guide

If UART port is used in Null Modem, the pin "RI" can be used as an interrupt signal to HOST. Normally it will keep high logic level until certain condition such as receiving SMS, voice call (CSD, video) or URC

reporting, then "RI" will change to low logic level to inform the master (client PC). It will stay low until the master clears the interrupt event with AT command.

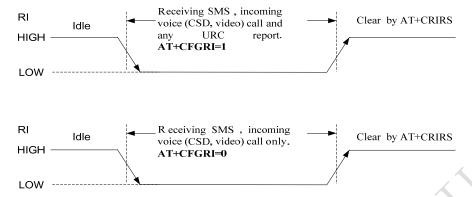

Figure 19: RI behaviour in NULL Modem

If Full Modem is used to establish communication between devices, the pin "RI" is another operation status. Initially it keeps high, when a voice call or CSD call comes, the pin "RI" will change to low for about 5900ms, then it will return to high level for 100ms. It will repeat this procedure until this call is answered or hung up.

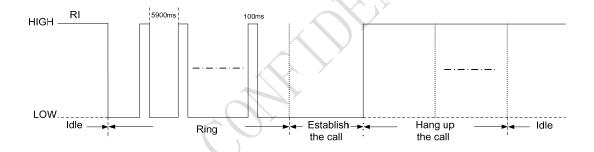

Figure 20: RI behaviour in FULL Modem

To comply with RS-232 protocol, the RS-232 level shifter chip should be used to connect SIM5360 to the RS-232-C interface. In this connection, the TTL level and RS-232 level are converted mutually. SIMCom recommends that user uses the SP3238ECA chip with a full modem. For more information please refers to the RS-232 chip datasheet.

Note: SIM5360 supports the communication rate: 300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200, 230400, 460800, 921600, 3200000, 3686400, 4000000bps. Default rate is 115200bps.

3.4 SD/MMC Interface

SIM5360 provides one 4-bit SD/MMC interface. Its operation voltage is 2.85V, with clock rates up to 52 MHz.It supports 1-bit SD/MMC or 4-bit SD data transmission mode. Though the same hardware

controller is used, the initialization procession for SD or MMC cards is different. SIM5360 will detect which card is inserted automatically.

3.4.1 Pin Description

Table 10: Electronic characteristic

Pin name	2.85V mode					
1 III IIaiiic	Min	Тур	Max			
SD_DATA0	2.7	2.85	3.0			
SD_DATA1	2.7	2.85	3.0			
SD_DATA2	2.7	2.85	3.0			
SD_DATA3	2.7	2.85	3.0			
SD_CLK	2.7	2.85	3.0			
SD_CMD	2.7	2.85	3.0			
VREG_SD	2.7	2.85	3.0			

Table 11: Pin description

Pin name	Pin No.	Function
SD_DATA0	22	SD/MMC card data0
SD_DATA1	23	SD card data1
SD_DATA2	24	SD card data2
SD_DATA3	25	SD card data3
SD_CLK	26	SD card clock
SD_CMD	21	SD card command
VREG_SD	44	SD card power

3.4.2 Design guide

The module provides a LDO named VREG_SD for SD card power supply. The LDO is 2.85V by default, capable of 300mA. Data lines should be pulled up to VREG_SD by 10K resistors. ESD/EMI components should be arranged beside SD card socket. Refer to the following application circuit.

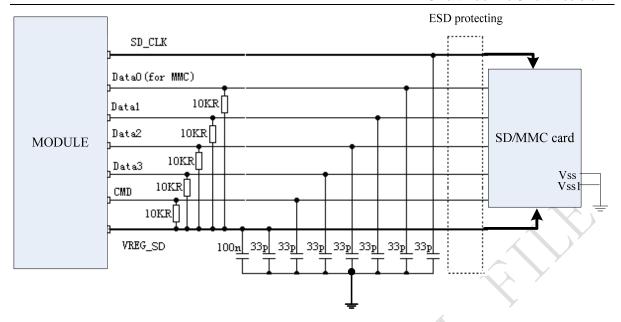

Figure 21: SD interface circuit

3.5 USIM Interface

The USIM provides the required subscription verification information to allow the mobile equipment to attach to a GSM or UMTS network. Both 1.8V and 3.0V SIM Cards are supported.

3.5.1 Pin description

Table 12: Electronic characteristic

	-						
Din nama	3.0V mode	.0V mode			1.8V mode		
Pin name	Min	Тур	Max	Min	Тур	Max	
V_USIM	2.7	3.00	3.3	1.65	1.8	2.0

V_USIM

20

USIM Card Power output depends automatically on USIM mode, one is $3.0V\pm10\%$, another is $1.8V\pm10\%$. Current is less than 50mA.

3.5.2 Application Guide

It is recommended to use an ESD protection component such as ST (www.st.com) ESDA6V1W5 or ON SEMI (www.onsemi.com) SMF05C. Note that the SIM peripheral circuit should be close to the SIM card socket. The reference circuit of the 8-pin SIM card holder is illustrated in the following figure.

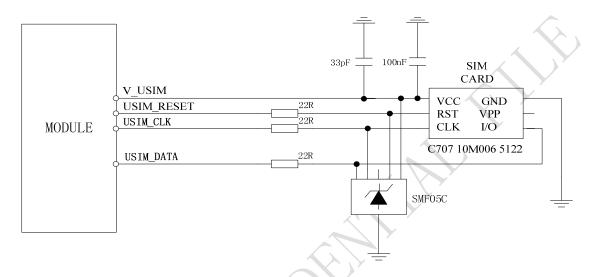

Figure 22: USIM interface reference circuit

Note: USIM_DATA has been pulled up with a 15kR resistor to V_USIM in module. A 220nF shut capacitor on V_USIM is used to reduce interference. Use AT Commands to get information in USIM card. For more detail, please refer to document [1].

3.5.3 Recommend Components

For 6 pins USIM socket, SIMCom recommend to use Amphenol **C707 10M006 512 2**. User can visit http://www.amphenol.com for more information about the holder.

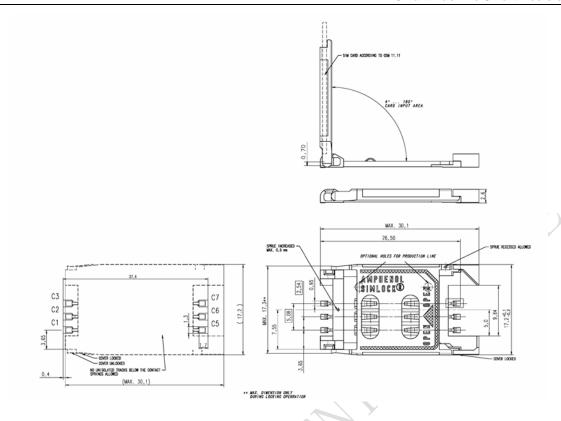

Figure 23: Amphenol SIM card socket

Table 19: Amphenol USIM socket pin description

Pin	Signal	Description
C1	USIM_VDD	SIM Card Power supply, it can identify automatically the SIM Card power mode, one is $3.0V\pm10\%$, another is $1.8V\pm10\%$.
C2	USIM_RST	SIM Card Reset.

C5	GND	Connect to GND.
C6	VPP	Connect to USIM_VDD
C7	USIM_DATA	SIM Card data I/O.

3.6 I2C Interface

I2C is used to communicate with peripheral equipments and can be operated as either a transmitter or receiver, depending on the device function. Use AT Commands "AT+CRIIC and AT+CWIIC" to read/write register values of related peripheral equipments connected with I2C interface. Its operation voltage is 1.8V.

3.6.1 Pin Description

Table 14: Pin description

Pin name	Pin No.	Function
I2C_SDA	56	Serial interface data input and output
I2C_SCL	55	Serial interface clock input

3.6.2 Signal Description

Both SDA and SCL are bidirectional lines, connected to a positive supply via a pull-up resistor respectively. When the bus is free, both lines are high.

3.6.3 Design Guide

For SIM5360, the data on the I2C bus can be transferred at rates up to 400kbps. The number of peripheral devices connected to the bus is solely dependent on the bus capacitance limit of 400pF. Note that PCB traces length and bending are in users' control to minimize load capacitance.

Note: I2C_SDA and I2C _SCL have none pulled up resistors in module. So there is need to pull them up in users' application circuit.

3.7 Keypad Interface

SIM5360 module provides a keypad interface that supports five sense lines, or columns, and five keypad rows. The interface generates an interrupt when any key is pressed. Its operation voltage is 1.8V.

3.7.1 Pin Description

Table 15: Pin description

Pin name	Pin No.	Function
KEYSENSE_N0	28	
KEYSENSE_N1	27	
KEYSENSE_N2	31	Sensing keys
KEYSENSE_N3	32	
KEYSENSE_N4	36	
KEYPAD_0	30	
KEYPAD_1	29	
KEYPAD_2	30	Driving pads
KEYPAD_3	35	
KEYPAD_4	34	

3.7.2 Application Guide

All keypad pins can be configured for GPIOs. These GPIOs also support interruption operation if used as input pins. A typical circuit about the keypad (5*5 keypad matrix) is shown in the following figure.

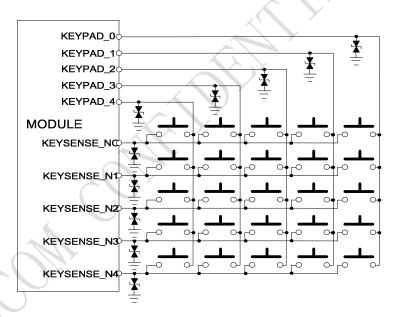

Figure 24: Reference circuit

If these pins are configured for GPIOs, the sequence is listed in the following table.

Table 16: GPIO configuration

Keypad interface	GPIO No.
KEYPAD_4	GPIO6
KEYPAD_3	GPIO7
KEYPAD_2	GPIO8
KEYPAD_1	GPIO9
KEYPAD_0	GPIO10
KEYSENSE_N4	GPIO11
KEYSENSE_N 3	GPIO12
KEYSENSE_N 2	GPIO13
KEYSENSE_N 1	GPIO14
KEYSENSE_N 0	GPIO15

Note: Refer to document [23] for detailed information of Keypad Application Note.

3.8 USB Interface

SIM5360 module contains a USB interface. This interface is compliant with the USB2.0 specification. The USB2.0 specification requires hosts such as the computer to support all three USB speeds, namely low-speed (1.5Mbps), full-speed (12Mbps) and high-speed (480Mbps). USB charging and USB-OTG is not supported.

Table 17: Electronic characteristic

Pin name	Pin No.	Input voltage scope(V)			
rm name		Min	Тур	Max	
USB_VBUS	11	3	5.0	5.25	
USB_DP	13	They are compliant with the USB 2.0 specification.			
USB_DM	12	They are compliant	with the USB 2.0 s	респисацоп.	

3.8.1 Application Guide

Currently SIM5360 supports the USB suspend and resume mechanism which can help to save power. If no transaction is on USB bus, SIM5360 will enter suspend mode. When some events such as voice call or receiving SMS happen, SIM5360 will resume normal mode automatically.

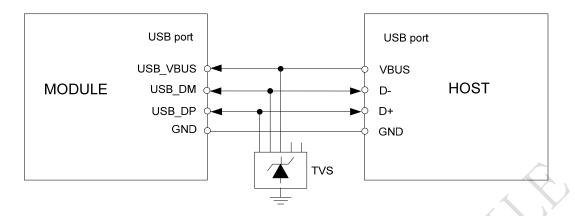

Figure 25: USB interface

Because of high bit rate on USB bus, pay attention to influence of junction capacitance of ESD component on USB data lines. Typically, the capacitance should be less than 4pF @1MHz.

Note: The SIM5360 has two kinds of interface (UART and USB) to connect to host CPU. USB interface is mapped to five virtual ports: "SIMTECH USB Modem", "SIMTECH HS-USB NMEA 9000", "SIMTECH HS-USB AT port 9000", "SIMTECH HS-USB Diagnostics 9000" and "SIMTECH Wireless Ethernet Adapter".

3.9 SPI Interface

SPI interface of SIM5360 is master only. It provides a duplex, synchronous, serial communication link with peripheral devices. Its operation voltage is 1.8V, with clock rates up to 26 MHz.

3.9.1 Pin Description

Table 18: Electronic characteristic

Pin name	DC Characteristics					
riii iiailie	Min	Тур	Max			
SPI_CLK	-0.3	1.8	2.1			
SPI_CS_N	-0.3	1.8	2.1			
SPI_MOMI_DATA	-0.3	1.8	2.1			
SPI_MIMO_DATA	-0.3	1.8	2.1			

Table 19: Pin description

Pin name	Pin No.	Function
SPI_CS	9	SPI chip-select; not mandatory in a point-to-point connection
SPI_MISO_DATA	7	SPI master in/slave out data
SPI_CLK	6	SPI clock
SPI_MOSI_DATA	8	SPI master out/slave in data

3.10 GPIO Interface

SIM5360 provides a limited number of GPIO pins. All GPIOs can be configured as inputs or outputs. User can use AT Commands to read or write GPIOs status. Refer to ATC document for details.

3.10.1 Pin Description

Table 20: Electronic characteristic

Pin name	DC Characteristics					
	Min	Тур	Max			
GPIO1	-0.3	1.8	2.1			
GPIO4	-0.3	1.8	2.1			
GPIO40	-0.3	1.8	2.1			
GPIO41	-0.3	1.8	2.1			
GPIO43	-0.3	1.8	2.1			
GPIO44	-0.3	1.8	2.1			
GPIO42	-0.3	1.8	2.1			

Note: If more GPIOs need to be used, users can configure GPIO on other multiple function interfaces, such as PCM. Please refer to GPIO list.

Table 21: Pin description

Pin name	Pin No.	I/O	Function
GPIO1	51	O	Output PIN as LED control for network status. If it is unused, left open.
GPIO4	54	I	Input PIN as RF operating control. H: Normal Mode L:Flight Mode If it is unused, left open.
GPIO40	49	О	Output PIN as operating status indicating of module. H: Power on L: Power off If it is unused, left open.
GPIO41	52	I/O	General input/output PIN. It can be used as wake/interrupt signal to host from module If it is unused, left open.
GPIO42	53	I/O	General Purpose Input/Output Port.
GPIO43	50	I/O	General Purpose Input/Output Port. It can be used as wake/interrupt signal to module from host. If it is unused, left open.
GPIO44	48	I/O	General Purpose Input/Output Port

Note: The output driver current of GPIOs is 2mA.

3.10.2 Application Guide

Network status

GPIO1 is used to control Network Status LED; application circuit is shown below.

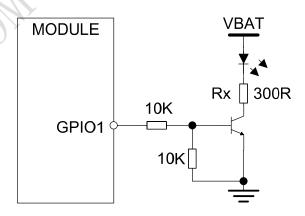

Figure 26: Application circuit

Note: The value of resistor Rx depends on LED characteristic.

Table 22: LED status

LED Status	Module Status
Always On	Searching Network/Call Connect
200ms ON, 200ms OFF	Data Transmit
800ms ON, 800ms OFF	Registered network
Off	Power off / Sleep

Flight mode control

GPIO4 controls SIM5360 module to enter or exit the Flight mode. In Flight mode, SIM5360 closes RF function to prevent interference with other equipments or minimize current consumption. Bidirectional ESD protection component is suggested to add on GPIO4.

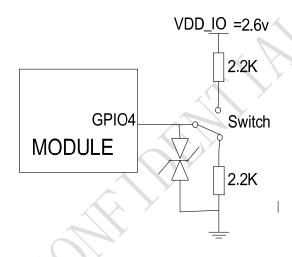

Figure 27: Flight mode switch

Table 23: Control status

GPIO4 Status	Module operation
Low Level	Flight Mode: RF is closed.
High Level	Normal Mode: RF is working.

Note: 1. For SIM5360, GPIO0, GPIO2, GPIO3 and GPIO5 have multiplex function, user can use them as PCM interface to connect extend codec. Refer to section 3.10 and document [1] for details.

2. When the module is powered off, make sure all digital interfaces (PCM UART, etc) connected with peripheral devices have no voltage higher than 0.3V. If users' design cannot meet above conditions, high level voltages maybe occur in GPIO pins because current leakage from above digital interfaces may occur.

3.11 PCM Interface

SIM5360 provides hardware PCM interface for external codec. The PCM interface enables communication with an external codec to support hands-free applications. SIM5360 PCM interface can be used in two modes: the default mode is auxiliary PCM (8 KHz long sync mode at 128 KHz PCM CLK); the other mode is primary PCM (8 KHz short sync mode at 2048 KHz PCM CLK). In short-sync (primary PCM) mode, SIM5360 can be a master or a slave. In long-sync (auxiliary PCM) mode, SIM5360 is always a master. SIM5360 also supports 3 kinds of coding formats: 8 bits (v-law or A-law) and 16 bits (linear).

Note: PCM interface is multiplexed from GPIO (default setting). The AT command "AT+CPCM" is used to switch between PCM and GPIO functions. Please refer to document [22] and document [1] for details.

3.11.1 Pin Description

Table 24: Electronic characteristic

Pin name	DC Characteristics				
riii iiailie	Min	Тур	Max		
PCM_CLK	-0.3	1.8	2.1		
PCM_SYNC	-0.3	1.8	2.1		
PCM_DOUT	-0.3	1.8	2.1		
PCM_DIN	-0.3	1.8	2.1		

Table 25: Pin description

Pins	Pin No.	AUX_PCM functionality	Primary PCM functionality	Description
PCM_DIN/GPIO0	74	AUX_PCM_DIN	PCM_DIN	PCM data input
PCM_SYNC/GPIO2	75	AUX_PCM_SYNC	PCM_SYNC	PCM data synchrony
PCM_DOUT/GPIO5	73	AUX_PCM_DOUT	PCM_DOUT	PCM data output
PCM_CLK/GPIO3	76	AUX_PCM_CLK	PCM_CLK	PCM data clock

3.11.2 Signal Description

The default PCM interface in SIM5360 is the auxiliary PCM interface. The data changes on the high level of PCM_CLK and is sampled at the falling edge of PCM_CLK in one period. Primary PCM is disabled after every power-on or every reset event. So user must use AT command to enable the primary PCM

mode after powering on or resetting the module every time if user wants to use Primary PCM.SIM5360 PCM Interface can be operated in Master or Slave mode if it is configured to primary PCM. In Master Mode, the Module drives the clock and sync signals that are sent to the external codec. When it is in Slave Mode, the external codec drives the clock and sync signals which are sent to the module. Both PCM modes are discussed in this section followed by additional PCM topics.

Auxiliary PCM (128 KHz PCM clock)

υ-law coding is supported by the auxiliary PCM. The auxiliary codec port operates with standard long-sync timing and a 128 KHz clock. The AUX_PCM_SYNC runs at 8 KHz with 50% duty cycle. Most υ-law codec support the 128 KHz clock.

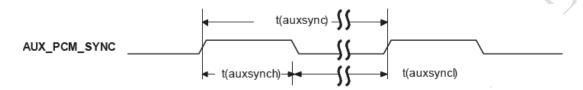

Figure 28: Synchrony timing

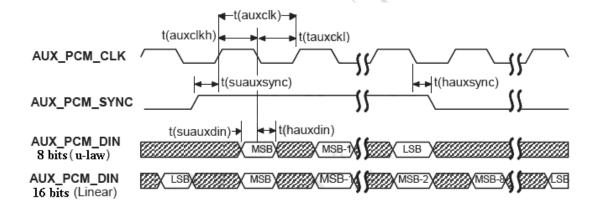

Figure 29: EXT CODEC to MODULE timing

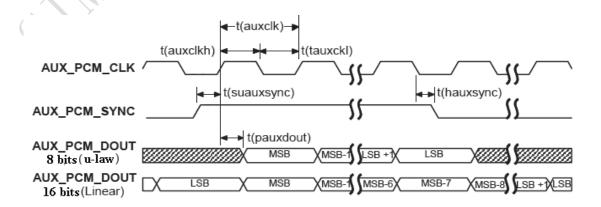

Figure 30: MODULE to EXT CODEC timing

Table 26: Timing parameters

Parameter	Description	Min	Тур	Max	Unit
T(auxsync)	AUX_PCM_SYNC cycle time	-	125	-	μs
T(auxsynch)	AUX_PCM_SYNC high time	62.4	62.5	-	μs
T(auxsyncl)	AUX_PCM_SYNC low time	62.4	62.5	-	μs
T(auxclk)*	AUX_PCM_CLK cycle time	-	7.8	_	μs
T(auxclkh)	AUX_PCM_CLK high time	3.8	3.9	-	μs
T(auxclkl)	AUX_PCM_CLK low time	3.8	3.9	-	μs
T(suauxsync)	AUX_PCM_SYNC setup time high before falling edge of PCM_CLK	1.95	-	-	μs
T(hauxsync)	AUX_PCM SYNC hold time after falling edge of PCM_CLK	1.95	-	-	μs
T(suauxdin)	AUX_PCM_DIN setup time before falling edge of AUX_PCM_CLK	70	-	-	ns
T(hauxdin)	AUX_PCM_DIN hold time after falling edge of AUX_PCM_CLK	20	_	_	ns
T(pauxdout)	Delay from AUX_PCM_CLK rising to AUX_PCM_DOUT valid	_	-	50	ns

^{*}Note: T(auxclk) = 1/(128 KHz).

Primary PCM (2048 KHz PCM clock)

SIM5360 also supports 2.048 MHz PCM data and sync timing for υ -law codec. This is called the primary PCM interface. User can use AT command to take the mode you want as discussed above.

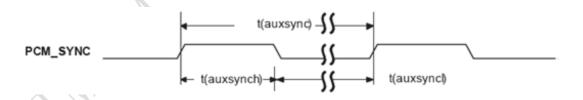

Figure 31: Synchrony timing

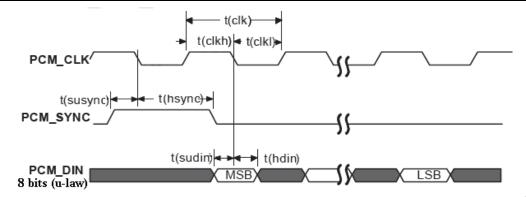

Figure 32: EXT CODEC to MODULE timing

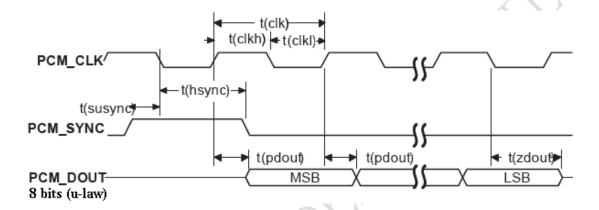

Figure 33: MODULE to EXT CODEC timing

Table 27: Timing parameters

Parameter	Description	Min	Тур	Max	Unit
T(sync)	PCM_SYNC cycle time	-	125	-	μs
T(synch)	PCM_SYNC high time		500	-	ns
T(syncl)	PCM_SYNC low time	-	124.5	-	μs
T(clk)	PCM_CLK cycle time	-	488	-	ns
T(clkh)	PCM_CLK high time	-	244	-	ns
T(clkl)	PCM_CLK low time	-	244	_	ns
T(susync)	PCM_SYNC setup time high before falling edge of PCM_CLK	60	-	-	ns
T(hsync)	PCM_SYNC hold time after falling edge of PCM_CLK	60	-	-	ns
T(sudin)	PCM_DIN setup time before falling edge of PCM_CLK	50	-	-	ns
T(hdin)	PCM_DIN hold time after falling edge of PCM_CLK	10	-	-	ns
T(pdout)	Delay from PCM_CLK rising to PCM_DOUT valid	-	-	350	ns

T(zdout)	Delay from PCM_CLK falling to PCM_DOUT		160		***
1 (Zuout)	HIGH-Z	_	100	_	ns

Note: SIM5360 can transmit PCM data by USB except for PCM interface. Please refer to document [22] for more information of PCM Application Note.

3.12 Global Navigation Satellite System

SIM5360 merges GPS/GLONASS satellite and network information to provide a high-availability solution that offers industry-leading accuracy and performance. This solution performs well, even in very challenging environmental conditions where conventional GPS/GLONASS receivers fail, and provides a platform to enable wireless operators to address both location-based services and emergency mandates.

3.12.1 Technical specification

Tracking sensitivity
TBD dBm
Cold-start sensitivity
TBD dBm
Accuracy (Open Sky)
TBD (CEP50)

TTFF (Open Sky) Hot start <1s Cold start 35s (good signal) / 100s (weak signal)

Receiver Type 16-channel, GPS L1 Frequency (1575.42MHz), C/A Code

Update rate Default 1 Hz
GPS data format NMEA-0183

GPS Current consumption (WCDMA/GSM Sleep mode) TBD (Total supply current)

GPS antenna Passive/Active antenna

Note: Performance will vary depending on the environment, antenna type and signal conditions and so on.

3.12.2 Operate Mode

SIM5360 supports both A-GPS and S-GPS, and then provides three operating modes: mobile-assisted mode, mobile-based mode and standalone mode. A-GPS includes mobile-assisted and mobile-based mode.

In mobile-assisted mode, when a request for position location is issued, available network information is provided to the location server (e.g. Cell-ID) and assistance is requested from the location server. The location server sends the assistance information to the handset. The handset/mobile unit measures the GPS observables and provides the GPS measurements along with available network data (that is appropriate for the given air interface technology) to the location server. The location server then calculates the position location and returns results to the requesting entity.

In mobile-based mode, the assistant data provided by the location server encompasses not only the information required to assist the handset in measuring the satellite signals, but also the information required to calculate the handset's position. Therefore, rather than provide the GPS measurements and

available network data back to the location server, the mobile calculates the location on the handset and passes the result to the requesting entity.

In standalone (autonomous) mode, the handset demodulates the data directly from the GPS satellites. This mode has some reduced cold-start sensitivity, and a longer time to first fix as compared to the assisted modes. However, it requires no server interaction and works out of network coverage.

This combination of GPS measurements and available network information provides:

- High-sensitivity solution that works in all terrains: Indoor, outdoor, urban, and rural
- High availability that is enabled by using both satellite and network information

Therefore, while network solutions typically perform poorly in rural areas and areas of poor cell geometry/density, and while unassisted, GPS-only solutions typically perform poorly indoors. The SIM5360 GPS solution provides optimal time to fix, accuracy, sensitivity, availability, and reduced network utilization in both of these environments, depending on the given condition.

3.12.3 Application Guide

Users can adopt an active antenna or a passive antenna as GPS signal transceiver. In this document, all GPS specification mentioned is from passive antenna. The following is the reference circuit.

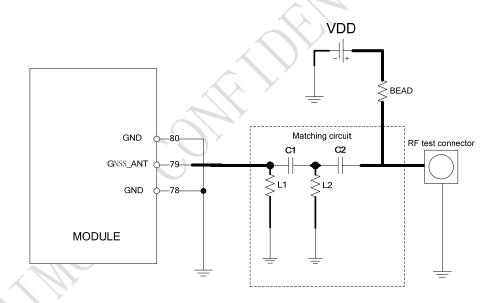

Figure 34: Active antenna circuit

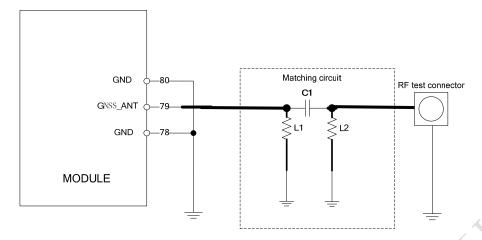

Figure 35: Passive antenna circuit (Default)

In above figures, the components C1 and L1, L2 are used for antenna matching, the values of the components can only be obtained after the antenna tuning usually, and they are provided by antenna vendor.C2 in Figure 36 is used for DC isolation. In active antenna circuit, users must use an external LDO/DCDC to provide VDD voltage whose value should be taken according active antenna characteristic, and VDD can be shut down to avoid consuming additional current when not being used.

GPS can be used by NMEA port. User can select NMEA as output through UART or USB. NMEA sentences are automatic and no command is provided. NMEA sentences include GSV, GGA, RMC, GSA, and VTG. Before using GPS, user should configure SIM5360 in proper operating mode by AT command. Please refer to related document for details. SIM5360 can also get position location information through AT directly.

Note: GPS is closed by default, it could be started by AT+CGPS. The AT command has two parameters, the first is on/off, and the second is GPS mode. Default mode is standalone mode.

AGPS mode needs more support from the mobile telecommunication network. Refer to AGPS application document for details.

3.13 Multi-functional interface

SIM5360 merges functions for various applications. It can enrich users' design and lower the cost of users' hardware.

3.13.1 Sink Current Source

The dedicated pin (CURRENT_SINK) is intended for driving passive devices, such as LCD backlight, this implementation is VBAT tolerant and suitable for driving white LEDs. The high-current driver can maintain a constant current which is set by *the AT command "AT+ CLEDITST"*, capable of up to 40 mA.

Table 28: Electronic characteristic

Symbol	Description	Min	Тур	Max	Unit
CURRENT_SINK	Input voltage	0.5	VDD	VBAT	V
I_{O}	Input current	5	-	40	mA

Since the driver is ground-referenced current sink, the operating device it drives must form a current path between the VDD pin and the CURRENT SINK pin. The following figure is for users reference.

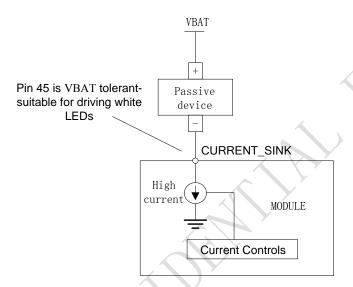

Figure 36: Current drive

Note: The sinking current can be adjusted to meet design requirement through the AT command "AT+ CLEDITST =<0>, <value>".The "value" ranges from 0 to 15, on behalf of the current changes from 0mA to 150mA in steps of 10mA.

3.13.2 Reset Function

SIM5360 also have a RESET pin (PIN4) to reset the module. This function is used as an emergency reset only when AT command "AT+CPOF" and the POWER_ON pin has no effect. User can pull the RESET pin to ground, then the module will reset.

This pin is already pulled up in module, so the external pull-up resistor is not necessary. A 100nF capacitor close to the RESET pin is strongly recommended. A reference circuit is recommended in the following figure.

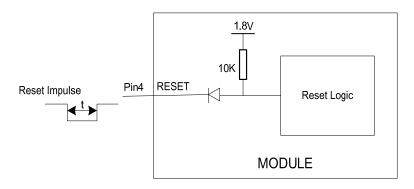

Figure 37: Reset circuit

Note: 50ms<t<200ms. ESD components are suggested to be used on Reset pin.

3.13.3 ADC

SIM5360 has a dedicated ADC that is available for digitizing analog signals such as battery voltage and so on; it is on PIN 47 and PIN 46, namely ADC1 and ADC2. This ADC is 15 bit successive-approximation circuit, and electronic specification is shown in the following table.

Table 29: Electronic Characteristics

Specification	Min	Тур	Max	Unit	Comments/Conditions
Resolution		15		Bits	
Analog input bandwidth	-	100	_	kHz	A 1 WILL ADOL C
Gain Error	-2.5		+2.5	%	Analog Vdd = ADC reference 2.4MHz sample rate
Offset Error	-3.5		+3.5	LSB	2.4WIIIZ Sample Tate
Input Range	GND		2.2V	V	
Input serial resistance		2		kΩ	Sample and hold switch resistance
Power supply current Normal operation		1.5		mA	
Power supply current Off		50	200	nA	

User can introduce a signal in the ADC pin directly and use the AT command "AT+CADC" to get the raw data which is between 0 and 32768. The data can be transformed to any type such as voltage, temperature etc. Please refer to *document* [1].

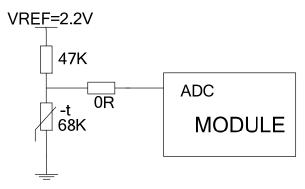

Figure 38: Reference circuit

Note: The input signal voltage value in ADC must not be higher than 2.2V.

3.13.4 LDO

SIM5360 has a LDO power output, namely VREG_SD. The LDO is available and output voltage is 2.85v by default, rated for 300mA. User can switch the LDO on or off by the AT command "AT+CVAUXS" and configure its output voltage by the AT command "AT+CVAUXV".

Table 30: Electronic characteristic

Symbol	Description	Min	Тур	Max	Unit
VREG_SD	Output voltage	1.5	2.85	3.05	V
I_{O}	Output current	-	-	300	mA

WCDMA 1900	<-108dBm
WCDMA 850	<-106dBm
WCDMA 900	<-106dBm

4.2 Operating Specification

SIM5360 can support high rate data by GSM/WCDMA wireless network. In the different network environment, data transmission rate shifts depending on modulation and encoding.

Table 34: GPRS/EDGE data throughout

Function	Coding schemes	1 Timeslot	2 Timeslot	4 Timeslot
	CS-1	9.05kbps	18.1kbps	36.2kbps

Category12	✓	5	1.8	QPSK

Note: Actual throughout rates depend on network configuration, network loading, signal condition and so on.

4.3 Antenna Design Guide

SIM5360 provides RF antenna interface. Customer's antenna should be located in the host board and connected to module's antenna pad through micro-strip line or other types of RF trace and the trace impedance must be controlled in 50Ω . SIMCom recommends that the total insertion loss between the antenna pad and antenna should meet the following requirements:

- GSM900/GSM850<0.5dB
- DCS1800/PCS1900 < 0.9dB
- WCDMA 2100/1900<0.9dB
- WCDMA 900/850<0.5dB

To facilitate the antenna tuning and certification test, a RF connector and an antenna matching circuit should be added. The following figure is the recommended circuit.

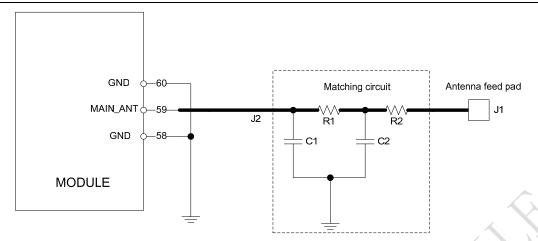

Figure 39: Antenna matching circuit(MAIN_ANT)

In this figure, the components R1,C1,C2 and R2 is used for antenna matching, the value of components can only be got after the antenna tuning, usually, they are provided by antenna vendor. By default, the R1, R2 are 0 ohm resistors, and the C1, C2 are reserved for tuning.

The RF test connector in the figure is used for the conducted RF performance test, and should be placed as close as to the module's antenna pin. The traces impedance between components must be controlled in 50ohm.

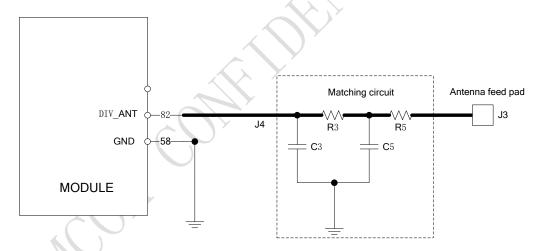

Figure 40: Antenna matching circuit(DIV_ANT)

In above figure, the components R3,C3,C5 and R5 is used for diversity antenna matching. The method of antenna tuning is same as MAIN_ANT.

5 Reliability and Operating Characteristics

5.1 Electronic Characteristics

Absolute maximum rating for digital and analog pins of SIM5360 are listed in the following table:

Table 36: Absolute maximum ratings

Parameter	Min	Max	Unit
Voltage at digital pins (1.8v digital I/O)	-0.3	2.1	V
Voltage at VBAT	-0.5	6.0	V
Voltage at VRTC	2	3.25	V
Voltage at USB VBUS	-0.5	6.0	V

Table 37: Recommended operating ratings

Parameter	Min	Тур	Max	Unit
Voltage at digital pins (1.8v digital I/O)	0	1.8	1.95	V
Voltage at VBAT	3.3	3.8	4.2	V
Voltage at VRTC	2	-	3.2	V
Voltage at USB_VBUS	3	5	5.25	V

The operating temperature and power specification is listed in the following table.

Table 38: Operating temperature

Parameter	Min	Тур	Max	Unit
Normal operation temperature	-30	25	80	$^{\circ}$ C
Extended operation temperature	-40	25	85	$^{\circ}$ C
Storage temperature	-40	25	+90	${\mathbb C}$

Note: SIMCom recommends user to install a heat sink on the module shielding case if SIM5360 operates in WCDMA band.

5.2 Operating Mode

The following table summarizes the various operating modes, each operating modes will be referred to in the following chapters.

5.2.1 Operating Modes Overview

Table 39: Operating Modes Overview

Mode Function

Sleep mode	GSM/WCDM	Module will automatically enter SLEEP mode if DTR is set to high level and there is no on air or hardware interrupt (such as GPIO interrupt or data on serial port). In this case, the current consumption of module will be reduced to the
Steep mode	A SLEEP	minimal level. In SLEEP mode, the module can still receive paging message, voice
		call and SMS.
	GSM IDLE	Software is active. Module has registered to the GSM network, and the module is ready to communicate.
GSM	GSM TALK	Connection between two subscribers is in progress. In this case, the power consumption depends on network settings (DTX off/on, FR/EFR/HR, hopping sequences, etc.) and antenna.
	GPRS STANDBY	Module is ready for GPRS data transfer, but no data is currently sent or received. In this case, power consumption depends on network settings and GPRS configuration.
GPRS	GPRS DATA	There is GPRS data transfer (PPP or TCP or UDP) in progress. In this case, power consumption is related with network settings (e.g. power control level), uplink/downlink data rates and GPRS configuration (e.g. used multi-slot settings).
EDGE	EDGE STANDBY	Module is ready for data transfer in EDGE mode, but no data is currently sent or received. In this case, power consumption depends on network settings and EDGE configuration
EDGE	EDGE DATA	There is EDGE data transfer (PPP or TCP or UDP) in progress. In this case, power consumption is related with network settings (e.g. power control level), uplink/downlink data rates and EDGE configuration.
WCDMA	WCDMA IDLE	Module has registered to the WCDMA network, and the module is ready to communicate.
WCDWIA	WCDMA TALK	Module is active in WCDMA mode. The power consumption depends on network settings.
	HSDPA IDLE	Module is ready for data transmission, but no data is currently sent or received. Power consumption depends on network settings and HSDPA configuration
HSDPA	HSDPA DATA	There is HSDPA data transfer (PPP or TCP or UDP) in progress. In this case, power consumption is related with network settings (e.g. power control level), uplink/downlink data rates and HSDPA configuration
Power down	pin. The power power supply of	powered down by the AT command "AT+CPOF" or the POWER_ON management unit shuts down the power supply of the module, only the of RTC is remained. The serial interface is not accessible. Operating sted to VBAT) remains applied.
Minimum functionality mode	functionality m the module will	nand "AT+CFUN" can be used to set the module to a minimum ode without removing the power supply. In this mode, the RF part of not work or the SIM card will not be accessible, or both will be closed, ort is still accessible. The power consumption in this mode is very low.

5.2.2 Minimize Power Consumption

There are two modes that SIM5360 achieves low power consumption.

Sleep mode

If peripheral equipments stops working, and there is no on air or hardware interrupts (such as GPIO interrupts or data on UART), SIM5360 will enter sleep mode automatically. In this mode, SIM5360 can still receive paging, voice call or SMS from network. If USB interface of SIM5360 is connected to host CPU, but host CPU does not support USB suspending, then SIM5360 will not enter sleep mode. After USB is disconnected, SIM5360 will enter sleep mode.

Note: When UART interface is connected with host CPU, SIM5360 can not enter sleep mode until RXD is pulled down by the host CPU. If the module is in the idle mode, make sure to pull the RXD to low level by host CPU. SIMCom recommends using GPIO43 or UART_DTR to wake up the module from host CPU and to use GPIO41 or UART_RI to wake up the host CPU. Before designing, pay attention to how to realize waking function and refer to Document[24] and Document[25] for more detail.

Minimum functionality mode

Minimum functionality mode ceases a majority function of module, thus minimizing the power consumption. This mode is set by the AT command which provides a choice of the functionality levels.

- AT+CFUN=0: Minimum functionality
- AT+CFUN=1: Full functionality (Default)
- AT+CFUN=4: Disable RF function of the module (Flight mode)

If SIM5360 has been set to minimum functionality mode, the module will firstly enter sleep mode, then the RF function and SIM card function will be closed. In this case, the serial port is still accessible, but RF function or SIM card will be unavailable. When SIM5360 is in minimum functionality or flight mode, it can return to full functionality by the AT command "AT+CFUN=1".

Note: For flight mode, please refer to Chapter 3.10.2.

5.3 Current Consumption

The current consumption in suspended mode and without USB connection is listed in the table below. Here, "suspended mode" means that SIM5360 is connected to USB bus, but it does not transfer data.

Table 40: Current consumption

Sem Sleep mode (without USB connection) Sleep @DRX=2 TBDmA

5.4 EMC and ESD Notes

EMC tests should be performed to detect any potential problems. Possible harmful emissions radiate by the application to the RF receiver in the receiver band. RF emissions interfere with audio input/output. It is recommended to shield the sensitive components and trace with common ground and user can add beads where necessary.

Normally SIM5360 is mounted on customer host board. Although some ESD components have been added in SIM5360, to prevent ESD, user should put some ESD components on customers' board. The ESD components should be placed beside the connectors which human body might touch, such as SIM card holder, audio jacks, switches, keys, etc. The following table is the SIM5360 ESD measurement performance; the results are from SIMCom EVB test.

Table 41: The ESD performance measurement table (Temperature: 25°C, Humidity: 45%)

Part	Contact discharge	Air discharge
VBAT,GND	±5KV	±10KV
UART,USB	±2KV	±6KV
Antenna port	±5KV	±10KV
Other ports	±2KV	±2KV

6 Guide for Production

6.1 Top and Bottom View of SIM5360

TBD

Figure 41: Top and bottom view of SIM5360

These test points are only used for module manufacturing and testing. They are not for customer's application.

6.2 Typical Solder Reflow Profile

For customer convenience, SIMCom provides a typical example for a commonly used soldering profile. In final board assembly, the typical solder reflow profile will be determined by the largest component on the board, as well as the type of solder/flux used and PCB stack-up. Therefore the soldering profile shown below is only a generic recommendation and should be adjusted to the specific application and manufacturing constraints.

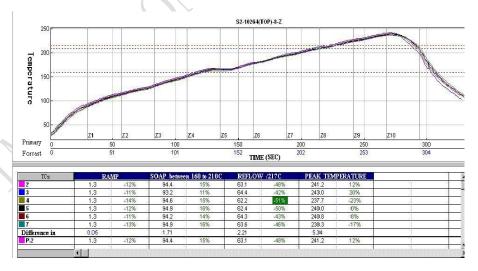

Figure 42: The ramp-soak-spike reflow profile of SIM5360

For details about secondary SMT, please refer to document [26].

6.3 Moisture Sensitivity Level (MSL)

SIM5360 is qualified to Moisture Sensitivity Level (MSL) 5 in accordance with JEDEC J-STD-020. After the prescribed time limit exceeded, users should bake modules for 192 hours in drying equipment (<5% RH) at 40° C +5° C/-0° C, or 72 hours at 85° C +5° C/-5° C. Note that plastic tray is not heat-resistant, users must not use the tray to bake at 85° C or the tray may be damaged.

6.4 Stencil Foil Design Recommendation

The recommended thickness of stencil foil is more than 0.15mm.

6.5 Recommended Pad Design

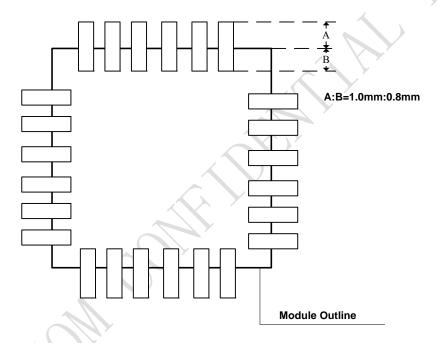

Figure 43: Recommended pad

Note: More designing details refer to Figure 6.

C. Digital I/O Characteristics

Table 43: Digital I/O characteristics

D	D	1.8V Digital I/O			TT . 4
Parameter	Description	Min	Тур	Max	Unit
$V_{ m IH}$	High-level input voltage	1.26	1.8	2.1	V
V_{IL}	Low-level input voltage	-0.3	0	0.63	V
V_{OH}	High-level output voltage	1.35	1.8	1.8	V

V_{OL}	Low-level output voltage	0	0	0.45	V
ЮН	High-level output current	-	1	-	mA
IOL	Low-level output current	-	-1	-	mA
I_{IH}	Input high leakage current	-	-	1	uA
$I_{\rm IL}$	Input low leakage current	-1	-	-	uA
C _{IN}	Input capacitance	-	-	7	pF

Note: These parameters are for digital interface pins, such as keypad, GPIO, I^2C , UART, SPI. Digital I/O specifications under both conditions are presented in the above tables.

SPI and keypad are 1.8v Digital I/O voltage.

GPIO, I²C and UART are 2.6v Digital I/O voltage.

E. Terms and Abbreviations

Table 45: Terms and Abbreviations

Abbreviation	Description
ADC	Analog-to-Digital Converter
ARP	Antenna Reference Point
BER	Bit Error Rate
BTS	Base Transceiver Station
CS	Coding Scheme
CSD	Circuit Switched Data
CTS	Clear to Send
DAC	Digital-to-Analog Converter
DRX	Discontinuous Reception
DSP	Digital Signal Processor
DTE	Data Terminal Equipment (typically computer, terminal, printer)
DTR	Data Terminal Ready
DTX	Discontinuous Transmission
EFR	Enhanced Full Rate
EGSM	Enhanced GSM
EMC	Electromagnetic Compatibility
ESD	Electrostatic Discharge
ETS	European Telecommunication Standard
FCC	Federal Communications Commission (U.S.)
FD	SIM fix dialing phonebook
FDMA	Frequency Division Multiple Access
FR	Full Rate
GMSK	Gaussian Minimum Shift Keying
GPRS	General Packet Radio Service
GSM	Global Standard for Mobile Communications
HR	Half Rate
I2C	Inter-Integrated Circuit
IMEI	International Mobile Equipment Identity
Inorm	Normal Current
Imax	Maximum Load Current
kbps	Kilo bits per second
Li-Ion	Lithium-Ion
MO	Mobile Originated
MS	Mobile Station (GSM engine), also referred to as TE
MT	Mobile Terminated
PAP	Password Authentication Protocol
PBCCH	Packet Switched Broadcast Control Channel
PCB	Printed Circuit Board
PCS	Personal Communication System, also referred to as GSM 1900
RF	Radio Frequency
RMS	Root Mean Square (value)
RTC	Real Time Clock

Rx	Receive Direction
SIM	Subscriber Identification Module
SMS	Short Message Service
SPI	serial peripheral interface
TDMA	Time Division Multiple Access
TE	Terminal Equipment, also referred to as DTE
TX	Transmit Direction
UART	Universal Asynchronous Receiver & Transmitter
VSWR	Voltage Standing Wave Ratio
Vmax	Maximum Voltage Value
Vnorm	Normal Voltage Value
Vmin	Minimum Voltage Value
VIHmax	Maximum Input High Level Voltage Value
VIHmin	Minimum Input High Level Voltage Value
VILmax	Maximum Input Low Level Voltage Value
VILmin	Minimum Input Low Level Voltage Value
VImax	Absolute Maximum Input Voltage Value
VImin	Absolute Minimum Input Voltage Value
VOHmax	Maximum Output High Level Voltage Value
VOHmin	Minimum Output High Level Voltage Value
VOLmax	Maximum Output Low Level Voltage Value
VOLmin	Minimum Output Low Level Voltage Value
SM	SIM phonebook
NC	Not connect
EDGE	Enhanced data rates for GSM evolution
HSDPA	High Speed Downlink Packet Access
HSUPA	High Speed Uplink Packet Access
ZIF	Zero intermediate frequency
WCDMA	Wideband Code Division Multiple Access
VCTCXO	Voltage control temperature-compensated crystal oscillator
USIM	Universal subscriber identity module
UMTS	Universal mobile telecommunications system
UART	Universal asynchronous receiver transmitter

F. Safety Caution

Table 46: Safety caution

Marks	Requirements
₹	When in a hospital or other health care facility, observe the restrictions about the use of mobiles. Switch the cellular terminal or mobile off, medical equipment may be sensitive to not operate normally for RF energy interference.
X	Switch off the cellular terminal or mobile before boarding an aircraft. Make sure it is switched off. The operation of wireless appliances in an aircraft is forbidden to prevent interference with communication systems. Forget to think much of these instructions may lead to the flight safety or offend against local legal action, or both.
	Do not operate the cellular terminal or mobile in the presence of flammable gases or fumes. Switch off the cellular terminal when you are near petrol stations, fuel depots, chemical plants or where blasting operations are in progress. Operation of any electrical equipment in potentially explosive atmospheres can constitute a safety hazard.
	Your cellular terminal or mobile receives and transmits radio frequency energy while switched on. RF interference can occur if it is used close to TV sets, radios, computers or other electric equipment.
	Road safety comes first! Do not use a hand-held cellular terminal or mobile when driving a vehicle, unless it is securely mounted in a holder for hands free operation. Before making a call with a hand-held terminal or mobile, park the vehicle.
sos	GSM cellular terminals or mobiles operate over radio frequency signals and cellular networks and cannot be guaranteed to connect in all conditions, for example no mobile fee or a invalid SIM card. While you are in this condition and need emergent help, please remember using emergency calls. In order to make or receive calls, the cellular terminal or mobile must be switched on and in a service area with adequate cellular signal strength. Some networks do not allow for emergency call if certain network services or phone features are in use (e.g. lock functions, fixed dialing etc.). You may have to deactivate those features before you can make an emergency call. Also, some networks require that a valid SIM card be properly inserted in the cellular terminal or mobile.
